REPLACEMENT OF PART 08-03-00-00

1. Grind off the weld on the nut holding the latch bolt to be replaced. Remove the nut. Discard the old latch bolt & nut.

2. Install the latch bolt marked "A" on the winch end of the beam. Install the latch bolt marked "B" on the end of the beam opposite the winch.

BE SURE the latch bolt ("1" above) installs from the side of the beam tube ("2" above) with the tapered mounting plate ("3" above) so that the lock nut is on the outside of the beam tube as shown.

3. Tighten the lock nut ("1" above) completely against the mount tube ("2" above), then back it off just enough ("3" above) to provide freedom of rotation for the latch bolt assembly ("4" above).

OPERATION OF PART 08-03-00-00

1. Place the connecting beam in the tapered socket.

2. Lift the retaining bolt and tighten the wing nut until secure. **MAKE SURE** that the blade on the latch bolt is secure in the slot on the ladder frame.

3. Release the retaining bolt and allow it to drop down to prevent the backward rotation of the securing wing nut.

NOTE: When disassembling, raise the retaining bolt, loosen the wing nut and pivot the latch bolt assembly to pry the tapered socket open.
